Chapter 1

Introduction

PowerBoot is the solution for people who want to run some certain applications on their cellular phones upon booting up. **PowerBoot** maintains a startup list of applications and run them when the phone is switched on. Phone users can modify the startup list in **PowerBoot**. It is just like the Microsoft Windows startup folder on PC.

PowerBoot is designed for advanced mobile phone users. User determines which applications he wants to run and selects them in **PowerBoot**. The user himself should ensure his selected applications would not cause any problem.

Some screenshots are shown below.

Chapter 2

PowerBoot Tutorial

Let's take a step-by-step tutorial to see how to use **PowerBoot**.

When you run **PowerBoot** for the first time, there should be no data configured in **PowerBoot** so the startup list should be empty, as shown in the left picture.

Now you can add some applications into the startup list by opening the **Options** menu and selecting **Add installed App...** item.

You will see the "Installed Apps List" which contains applications installed on the phone. You can select any applications you want from the list and then add it to the startup list.

In this tutorial we take "Notepad" for example. Please find the application and select it.

PowerBoot will ask for your confirmation to add the application. Please select "**OK**".

Go back to check the startup list, you will see the "Notepad" application in the startup list.

Open **Options** menu and select **Enable PowerBoot**. Then **PowerBoot** will start automatically upon phone boot up.

Now close **PowerBoot** and reboot the phone. You will see Notepad is running after the phone boots up.

You may set **PowerBoot** to work in safe mode or quick mode. If safe mode is activated, when phone boots up, **PowerBoot** will ask for your confirmation before running each application in startup list. If quick mode is activated, **PowerBoot** will run all applications without query.

It is strong recommended you try in safe mode when you add any new application to startup list. After you make sure the new application would not cause problem to your phone, you can set **PowerBoot** to work in quick mode.

You can add Java program from "Java MIDlet" list to startup list. The "Java MIDlet" list contains all Java applications installed on the phone.

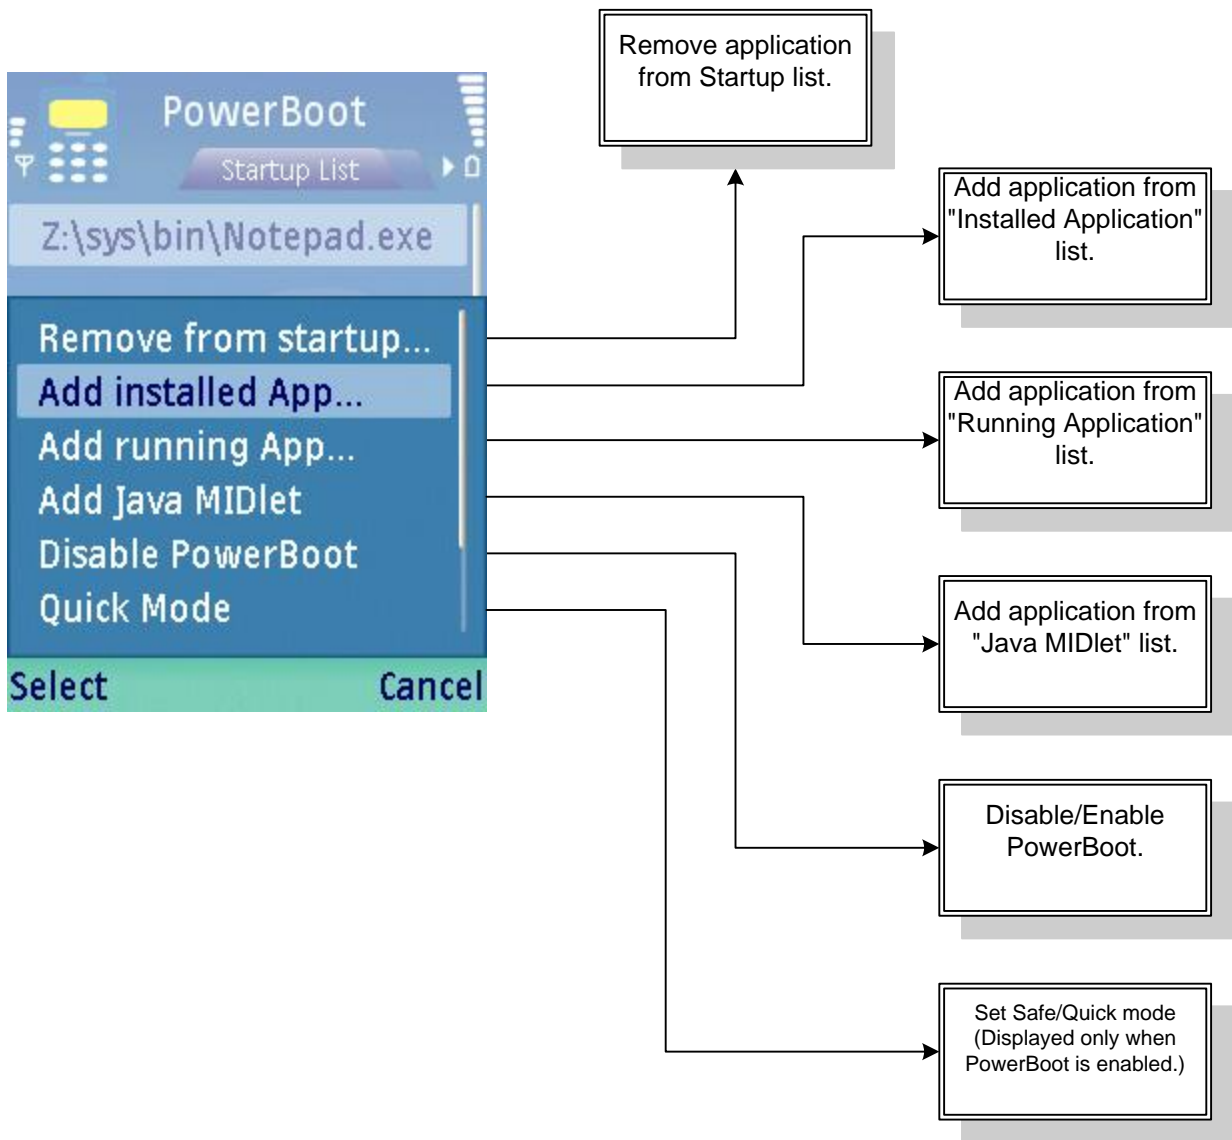

You can also add applications from "Running Apps" list to startup list. The "Running Apps" list contains applications currently running in the phone memory.

Chapter 3

PowerBoot Menu

PowerBoot is small and simple. Following diagram explains the PowerBoot main menus.
